Security Assessment:

We have identified potential security issues in the libraries this project is using. You can find all the details in the security assessments below. While your code might not expose you to the security threat at the moment, it's recommended to go through each of them and update your libraries to a non-vulnerable version.

Score: 0

Stability Assessment:

There are new patch releases available for one or more of the project dependencies declared in this project. You will find all the details in the stability section below. It is recommended to update your dependencies to the latest patch release to benefit of all the latest bugfixes. While you are looking at it, consider also having a look at the new minor and major releases (in the same table) that can offer you more advanced features.

Score: 0

Licensing Assessment:

One or more of the project dependencies may be using a forbidden license. You will find all the details in the licensing assessment section below. We strongly advise you to not ship your software until such problem is resolved.

SECURITY ASSESSMENT

Library (nodejs)

ajv - 6.12.0

Severity: **HIGH**

Description:

An issue was discovered in `ajv.validate()` in Ajv (aka Another JSON Schema Validator) 6.12.2. A carefully crafted JSON schema could be provided that allows execution of other code by prototype pollution. (While untrusted schemas are recommended against, the worst case of an untrusted schema should be a denial of service, not execution of code.)

Hierarchy:

fbp:0.1.0
ajv:6.12.0

braces - 1.8.5

Severity: **NONE**

Description:

Versions of "braces" prior to 2.3.1 are vulnerable to Regular Expression Denial of Service (ReDoS). Untrusted input may cause catastrophic backtracking while matching regular expressions. This can cause the application to be unresponsive leading to Denial of Service.. Recommendation: Upgrade to version 2.3.1 or higher.

chownr - 1.0.1

Severity: **LOW**

Description:

A TOCTOU issue in the `chownr` package before 1.1.0 for Node.js 10.10 could allow a local attacker to trick it into descending into unintended directories via symlink attacks.

elliptic - 6.5.2**Severity: HIGH**

Description:

The Elliptic package 6.5.2 for Node.js allows ECDSA signature malleability via variations in encoding, leading '\0' bytes, or integer overflows. This could conceivably have a security-relevant impact if an application relied on a single canonical signature.

Description:

For a proxy server running on `http://localhost:3000`, the following curl request triggers the unhandled exception: `curl -XPOST http://localhost:3000 -d "$(python -c 'print("x"1025)')"`

Hierarchy:

fbp:0.1.0
 @babel/plugin-transform-modules-commonjs:7.9.0
 @babel/helper-module-transforms:7.9.0
 lodash:4.17.15

Description:

Affected versions of "minimist" are vulnerable to prototype pollution. Arguments are not properly sanitized, allowing an attacker to modify the prototype of "Object", causing the addition or modification of an existing property that will exist on all objects.

Parsing the argument "--proto.y=Polluted" adds a "y" property with value "Polluted" to all objects. The argument "--proto=Polluted" raises an uncaught error and crashes the application.

This is exploitable if attackers have control over the arguments being passed to "minimist".

. Recommendation: Upgrade to versions 0.2.1, 1.2.3 or later.

 terser-webpack-plugin:1.2.2
 serialize-javascript:1.9.1

serialize-javascript - 1.9.1**Severity: MEDIUM**

Description:

The serialize-javascript npm package before version 2.1.1 is vulnerable to Cross-site Scripting (XSS). It does not properly mitigate against unsafe characters in serialized regular expressions. This vulnerability is not affected on Node.js environment since Node.js's implementation of RegExp.prototype.toString() backslash-escapes all forward slashes in regular expressions. If serialized data of regular expression objects are used in an environment other than Node.js, it is affected by this vulnerability.

tar - 4.4.1**Severity: HIGH**

Description:

A vulnerability was found in node-tar before version 4.4.2 (excluding version 2.2.2). An Arbitrary File Overwrite issue exists when extracting a tarball containing a hardlink to a file that already exists on the system, in conjunction with a later plain file with the same name as the hardlink. This plain file content replaces the existing file content. A patch has been applied to node-tar v2.2.2).

websocket-extensions - 0.1.3**Severity: HIGH**

Description:

websocket-extensions npm module prior to 1.0.4 allows Denial of Service (DoS) via Regex Backtracking. The extension parser may take quadratic time when parsing a header containing an unclosed string parameter value whose content is a repeating two-byte sequence of a backslash and some other character. This could be abused by an attacker to conduct Regex Denial Of Service (ReDoS) on a single-threaded server by providing a malicious payload with the Sec-WebSocket-Extensions header.

Description:

Affected versions of yargs-parser are vulnerable to prototype pollution. Arguments are not properly sanitized, allowing an attacker to modify the prototype of Object, causing the addition or modification of an existing property that will exist on all objects. Parsing the argument --foo.proto.bar baz' adds a bar property with value baz to all objects. This is only exploitable if attackers have control over the arguments being passed to yargs-parser.
